## GENERAL DESCRIPTION

The CS18LV02563 is a high performance, high speed and super low power CMOS Static Random Access Memory organized as 32,768 words by 8bits and operates from a wide range of 1.8 to 3.6V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed, super low power features and maximum access time of 55/70ns in 3.0V operation. Easy memory expansion is provided by an active LOW chip enable (/CE) and active LOW output enable (/OE).

The CS18LV02563 has an automatic power down feature, reducing the power consumption significantly when chip is deselected. The CS18LV02563 is available in JEDEC standard 28-pin TSOP I (8x13.4 mm), SOP (330 mil) and PDIP (600 mil) packages.

## FEATURES

- Wide operation voltage : 1.8 ~ 3.6V
- Ultra low power consumption :
  - 2mA@1MHz (Max.),  $V_{CC}=3.0V$ .
  - 0.10  $\mu A$  (Typ.) CMOS standby current
- High speed access time: 55/70ns.
- Automatic power down when chip is deselected.
- Three state outputs and TTL compatible.
- Data retention supply voltage as low as 1.5V.
- Easy expansion with /CE and /OE options.

## PIN CONFIGURATIONS

### FUNCTIONAL BLOCK DIAGRAM

### PIN DESCRIPTIONS

Name	Type	Function
A0 – A14	Input	Address inputs for selecting one of the 32,768 x 8 bit words in the RAM
/CE	Input	/CE is active LOW. Chip enable must be active when data read from or write to the device. If chip enable is not active, the device is deselected and in a standby power mode. The DQ pins will be in high impedance state when the device is deselected.
/WE	Input	The Write enable input is active LOW. It controls read and write operations. With the chip selected, when /WE is HIGH and /OE is LOW, output data will be present on the DQ pins, when /WE is LOW, the data present on the DQ pins will be written into the selected memory location.
/OE	Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when /OE is inactive.
DQ0~DQ7	I/O	These 8 bi-directional ports are used to read data from or write data into the RAM.
Vcc	Power	Power Supply
Gnd	Power	Ground

### READ CYCLE1 (1, 2, 4)

## READ CYCLE2 (1, 3, 4)

## READ CYCLE3 (1, 4)

**NOTES:**

1.  $\overline{WE}$  is high in read Cycle.
2. Device is continuously selected when  $\overline{CE} = V_{IL}$ .
3. Address valid prior to or coincident with  $\overline{CE}$  transition low.
4.  $\overline{OE} = V_{IL}$ .
5. Test conditions assume signal transition times of 5ns or less, timing reference levels of  $0.5V_{CC}$ , input pulse levels of 0V to  $V_{CC}$  and output loading specified in Figure 1A.

## NOTES:

1. /WE must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of /CE and /WE low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. TWR is measured from the earlier of /CE or /WE going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the /CE low transition occurs simultaneously with the /WE low transitions or after the /WE transition, output remain in a high impedance state.
6. /OE is continuously low ( $OE = V_{IL}$ )
7. DOUT is the same phase of write data of this write cycle.
7. DOUT is the read data of next address.
8. If /CE is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
9. Test conditions assume signal transition times of 5ns or less, timing reference levels of  $0.5V_{CC}$ , input pulse levels of 0V to  $V_{CC}$  and output loading specified in Figure 1A.
10. Transition is measured  $\pm 500mV$  from steady state with  $CL = 5pF$  as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. TCW is measured from the later of /CE going low to the end of write.
